Bzik,D.J., Debroy,C., Fox,B.A., Pederson,N.E. and Person,S.
The nucleotide sequence of the gB glycoprotein gene of HSV-2 and comparison with the corresponding gene of HSV-1
Virology 155 (2), 322-333 (1986)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A membrane spanning region was found at position 2717-2923. The authors proposed that a signal cleavage-recognition site exits after nuclectide 613. 'This would give a mature peptide of 882
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         HS2GB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Φ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequences of gB glycoprotein genes of HSV-1 and HSV-2 were compared and there was an overall amino acid homology of 85%. There were three major regions of homology at nucleotides 108-397, 484-785, and 835-873.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              glycoprotein; glycoprotein Human herpesvirus 2

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence represents a Herpes simplex virus type-2 (HSV-2) DNA sequence of the invention. This sequence was isolated from HSV-2 strain SB5 (deposited as ATCC VR-2546), is dealsymated Contig ID 14, and encodes a HSV-2 protein. The protein can be used for the treatment or prevention of disease, to induce an immunological response in a mammal or to identify inhibitors, activators or novel antivirals. Antagonists of the proteins can be used to inhibit a viral polypeptide. The DNA sequence or a vector containing it can also be used to induce an immunological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Chan JY,

This sequence was isolated from HSV-2 strain SB5 (deposited as ATCC VR-2546), is designated Contig ID 91, and encodes a HSV-2 protein. The proteins can be used for the treatment or prevention of disease, to induce an immunological response in a mammal or to identify inhibitors, activators or novel antivirals. Altagonists of the proteins can be used to inhibit a viral polypeptide. The DNA sequence or a vector containing it can also be used to induce an immunological

                                                                                                                    The present sequence is from the Herpes simplex virus (HSV) type I strain Patton and encodes a glycoprotein B. HSV is a double strained virus packaged within an icosohedral inucleocapsid enveloped within a membrane. The membrane includes a number of virus-specific glycoproteins, with glycoprotein B being one of the most abundant. Glycoprotein B from both HSV type I and type II are cross reactive. New vaccines comprising recombinantly produced glycosylated glycoprotein B that has a deletion of at least part of the transmembrane anchor region, in combination with a carrier and an adjuvant have been produced. The vaccines are used for immunising humans against HSV (HSV type 1) by vaccination before or after primary infection with HSV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Herpes simplex virus; HSV; type I; type II; glycoprotein membrane protein; virus-specific glycoprotein; transmembrane anchor region; ss.

The amino acid sequence and DNA sequence for gB 1 presented in AAP80914 and AAN80907 differ from that originally presented in Table 1 of International Publication No. WO 85/04587. The DNA sequence in Table 1 contains an error in that an additional nucleotide (G) is listed at position 607 which resulted in a shift in reading frame relative to AAN80907 from which this nucleotide has been deleted.

The HSV-1 and HSV-2 sequences are given in AAQ48496 and AAQ48497 respectively.

                                  CC bound to an aggregated protein-polycationic polymer conjugate or CC suspension. The expression vector contains a promoter polymucleotide C sequence operatively linked to a polymucleotide sequence encoding an CC antigen which is a fragment of a gene or genome associated with an CC infectious disease, cancer and autoimmune disease such as rheumatoid CC arthritis, vasculitis, and multiple sclerosis, pathogenic genomes CC consisting of bacterium, fungus, protozoa and virus such as human CC immunodeficiency virus (HIV), herpes simplex virus (HSV), hepatitis C C virus (HCV), influenza and respiratory syncytial virus (RSV), and CC virus (HCV), influenza and respiratory syncytial virus (RSV), and CC contains expression vector), is useful for inducing an immune response (systemic and/or mucosal) in an organism. The cytokine expression vector CC (GM-CSP) or interleukin-12 (IL-12). The polymucleotide sequences encoding the antigen and the cytokine are under transcriptional control of same or CC different promoter polymucleotide sequences. The expression vector, as a CC DNA vaccine is useful for treating a condition in an organism. The CC other invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Composition for oral delivery of vaccines, comprises expression containing antigenic genomic sequence, bound to aggregated protein-polycationic polymer conjugate or suspension
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Disclosure; Page 90-132; 145pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC The invention relates to human nucleic acids (AAI57798-AAI61369) and Ct the encoded polypeptides (AAM38642-AAM42213) with nootroppic, immunosuppressant and cytostatic activity. The polynucleotides are useful CC in gene therapy. A composition containing a polypeptide or polynucleotide CC of the invention may be used to treat diseases of the peripheral nervous System, such as peripheral nervous injuries, peripheral neuropathy and CC localised neuropathies and central nervous system diseases, such as CC Altheimer's, Parkinson's disease, Huntington's diseases, such as CC lateral Sclerosis, and Sy-Drager Syndrome. Other uses include the CC utilisation of the activities such as: Immune system suppression, CC activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic CC and thrombolytic activity, arthritis and therapy, drug screening, CC assays for receptor activity, arthritis and inflammation, leukaemias and CC C.N.S disorders.

CC Note: The sequence data for this patent did not form part of the printed CC enceptication.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel recombinant Eps15 homology (EH) domain containing protein 1 or 2 (EHD1 or EHD2) with an N-terminal region containing a nucleotide binding consensus site, a central coiled coil structure and a C-terminal region including an EH domain, where the polypeptide participates in endocytosis. The peptides, peptide analogues and/or the polynucleotide sequences are useful for regulating EHD1/2 protein activity in vivo, where the EHD1/2 protein and its gene are useful for upregulating the protein activity. The novel method is useful for lowering the rate of IGF1 signaling and therefore useful for suppressing adhesion, invasion and metastasis where EHD is overexpressed, and therefore endocytosis. The method is also useful for elongating IGF1 effects and therefore for increasing bone formation in osteoporosis conditions. This polynucleotide sequence represents the cDNA of a human EHD2 gene of the invention.
                                                                                                                                                                                                                                                          Human; nootropic; immunosuppressant; cytostatic; gene therapy; cancer; peripheral nervous system; neuropathy; central nervous system; CNS; Alzheimer's; Parkinson's disease; Huntington's disease; haemostatic; amyotrophic lateral sclerosis; Shy-Drager Syndrome; chemotactic; chemokinetic; thrombolytic; drug screening; arthritis; inflammation;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and c.N.S disnovers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Tang

                   The sequence encodes a truncated form of the HSVgB polypeptide. The recombinant protein can be used to prepare vaccines for prophylaxis of HSV infection and for use in diagnostic kits. See also AAQ14478.

Also disclosed are the nucleic acid molecules encoding the proteins are antibodies that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae infection, this may be in the form of a vaccine or gene therapy. Sequences given in records ABZ37706-ABZ42016 represent nucleic acid molecules of the invention.
                                                                                                               HSVgB polypeptide(s) obtd. useful as vaccines against cheaply and safely.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New protein from Neisseria gonorrheae, useful for the manufacture of medicament for treating or preventing N. gonorrheae infection \,\,

It can be used to produce vaccines for prophylaxis and treatment of HSV-1 and HSV-2. See AAN/1399 for the HSV-2 sequence. (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Vaccine; prophylaxis; treatment; Herpes Simplex Virus-1; glycoprotein; gB; ss.
